QUICK SELLING—PROFITABLE.

## “Perfect” Galvanized Wash Tub.

WITH CORRUGATED-STEEL WRINGER ATTACHMENT.

The corrugations give an excellent surface for the wringer clamps to grip. The steel strip is securely riveted and galvanized to the tub and adds strength. This is the original and the best. Look out for cheap, claptrap imitations, which are worthless.

No. 10	20 x 11 inches,	\$	doz.

## Handy Sifter and Strainer.

TINNED WIRE BOTTOM. SIZE, 7½ x 2½ INCHES.

No. 5	Plain	\$24.00 gro.
No. 15	Retinned	30.00 “

## MILK CANS.

If there is a line of goods that we try to make better and more perfect than any other, it is our line of milk cans. To no other goods have we given more care, thought and study. The *reason* for this is that the milk dealer is probably more particular about the milk cans he buys than other people usually are about the things they buy. The *result* is that we have a line of cans that is unequalled for strength of construction, wearing qualities, smoothness and freedom from imperfections of all kinds.

The breast, bottom and cover are drawn from soft annealed drawing steel of tough fiber, made by the mills especially for the purpose. The body plate is made of the best quality heavy tinned steel sheets, evenly coated and uniform, perfectly flat, without buckles. ***No better materials can be put into milk cans.***

### ILLINOIS PATTERN.

	5	8	10	gallons.
Cans made up,	\$3.00	4.20	4.50	each.
Stock complete,	2.50	3.70	4.00	per set.

A set of stock complete consists of everything to make the can except rivets and solder.

In the Illinois pattern the handles are riveted to the breast, and the receiver and neck, which are seamless construction, are attached to the breast, before retinning.

## MILK CANS—Continued.

### NEW YORK PATTERN.

	20	30	40	quarts.
Cans made up,	\$3.70	5.20	5.50	each.
Stock complete,	3.00	4.00	4.70	per set.

A set of stock complete consists of everything to make the can except rivets and solder.

The handles are riveted both to the body and to the breast, thus distributing the strain upon both. The handles are malleable iron, are large and fit the hand nicely. The rubber bumper is the best arrangement of the kind and is noiseless. The New York pattern cans are made of No. 18 body plate and are the heaviest cans on the market. The 30 and 40-quart are made with 7½-inch neck and 20-quart with 6-inch neck.

### Milk Can Bottom.

The illustration shows part of body and bottom cut away. The hoop is on the inside and is made with a thick shoulder. The edges of both body tin and bottom rest on this shoulder and are thus protected from all banging. The can rides on the thick wide edge, and not on the sharp edges of a hoop, a bottom and body sheet, and thus does not cut up the floors and wagons. The bottoms are finished with the hoops in, all retinned together, and punched for the rivets, which are drawn through the three thicknesses. Unequaled for protection, strength and simplicity. Heavier and more serviceable than any other made.

This style of bottom is used on all our cans except the Dubuque pattern.

## MILK CANS—Continued.

IOWA PATTERN.

	8	10	gallons.
Cans made up,	\$4.70	5.00	each.
Stock complete,	4.10	4.50	per set.

A set of stock complete consists of everything to make the can except rivets and solder.

The Iowa cans are made with the bottom hoop on the outside and galvanized, the shoulder upon which the bottom and body rest being turned inward, instead of outward as on the Illinois, New York and Baltimore patterns.

### Milk Can Breast.

(PATENTED.)

Breast Firmly Gripped between Shoulder (A) and Top of Hoop Turned Inward (B). Cannot be Displaced Up or Down. Also Supported by Hoop (C).

The hoop as now made is brought down a little further than shown in the illustration and tapers down against body of the can, making a smooth finish. The seamless neck and receiver are made separate from the breast because it is better construction. Where the breast, neck and receiver are drawn from one piece of metal the fibres of the metal are so distorted as to take the life out of it. The neck rim is separate from the cover, also, because this is a better construction. With the separate cover rim piece, such as we furnish, the dealer who makes up the can may accommodate the fit somewhat to the idea of his trade. Some want the cover to fit very tight, others looser. The bodies are rolled and punched ready to put together. This breast construction is used in all our cans.

## MILK CANS—Continued.

### DUBUQUE PATTERN.

	8	10 gallons.
Cans made up,	\$3.50	3.70 each.
Stock complete,	3.00	3.30 per set.

A set of stock complete consists of everything to make the can except rivets and solder.

The Dubuque pattern cans are similar to Iowa pattern, but are made of lighter body stock, and with a flat outside galvanized bottom hoop. They are just as well made as any of our cans and are the best low-priced cans in the market.

### BALTIMORE PATTERN.

	20	30	40 quarts.
Cans made up,	\$4.00	5.50	5.80 each.
Stock complete,	3.20	4.20	4.50 per set.

A set of stock complete consists of everything to make the can except rivets and solder.

This can has extra heavy cover and 7½-in. neck on 30 and 40-quart, and 6-in. on 20-quart. Heavily wired. Extra large heavy handles with rubber bumpers.

Furnished with hoop turned outside (like Iowa pattern) and galvanized or tinned, if desired, at small additional cost.

# UNION FACTORY MILK CANS AND TRIMMINGS.

## Factory Cans Made Up.

UNION CAN STOCK.

Complete with Center Hoop.

15-gallon	\$6.80 each.
20 “	7.55 “
30 “	8.55 “
40 “	10.55 “
50 “	11.80 “

If without ventilator, deduct 25 cents each from list.

A valuable feature of these cans is the bead or indentation, which is pressed into the body of the can by machinery made especially for this purpose. This bead effectually and completely prevents the slopping of milk while being transported over rough roads, as the milk, striking the bevel on the lower part of the bead, is thrown toward the center of the can, and it is thus prevented from passing up between the cover rim and the body of the can. The can may be filled within two inches of the top, and not a single drop will slop out in driving over a rough country road.

Another valuable feature is the method of ventilation. In the center of the can cover is placed a perforated tin disk, about six inches in diameter, which is protected from rain and dust by the removable tin cover, with perforations in the rim.

The cover is made without double seaming the cover rim to the cover, and makes a complete roof over the can, so that it may stand out of doors during a rain storm without any water getting into the milk, while the milk is all the time well ventilated.
